

# Hindustan Projects Website — Advanced Trust & Conversion Features

Additional prompts for Claude Code (or any AI coding assistant). Every prompt below is written as an AUDIT-FIRST prompt: the AI is instructed to first check whether the feature already exists in the codebase. If it exists and works correctly, it leaves it alone. If it exists but is incomplete/broken, it improves it. If it doesn't exist at all, it builds it fresh.

---

## 1. Client Testimonials + Video Reviews Section

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my React + Vite + Tailwind website codebase for an existing testimonials/reviews section. First: search the codebase and tell me if one already exists, and if so evaluate whether it properly displays client name, photo/company, quote, and rating -- and whether it's actually wired up on the homepage.

IF IT EXISTS AND IS CORRECT: tell me it's fine, no changes needed.

IF IT EXISTS BUT IS INCOMPLETE/BROKEN: fix and improve it to meet the requirements below.

IF IT DOES NOT EXIST: build it fresh.

Requirements: a 'Client Speaks' section on the homepage with a card carousel/grid showing client name, company, photo (use placeholder avatars if none provided), star rating, and short quote. Also add support for an optional embedded video testimonial (YouTube/Vimeo embed or self-hosted mp4) in place of a photo for select testimonials. Style to match my red/blue/white brand. Make content easily editable from a single data file (JSON or similar) so I can add new testimonials without touching component code.

## 2. FAQ Section with FAQ Schema

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my website codebase for an existing FAQ section on any service page. First: tell me if one already exists and whether it includes structured data (FAQPage JSON-LD schema).

IF IT EXISTS AND IS CORRECT (has schema + proper accordion UI): tell me it's fine, no changes needed.

IF IT EXISTS BUT IS INCOMPLETE (e.g. UI exists but no schema, or schema exists but not wired to visible content): fix and improve it.

IF IT DOES NOT EXIST: build it fresh.

Requirements: an expandable/collapsible FAQ accordion component, reusable across service pages, styled with my existing Tailwind theme. For each service page, add 5-6 relevant Q&A pairs (e.g. 'How long does it take to build a website?', 'Is maintenance included?', 'What is the payment structure?'). Generate matching FAQPage JSON-LD schema for each page via react-helmet-async so the content is crawlable and eligible for Google's expandable FAQ rich results. Confirm the schema content matches the visible FAQ content exactly (required by Google guidelines).

## 3. Live Chat Bot (AI-powered or rule-based)

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

#### PROMPT FOR AI:

Check my website codebase for any existing chat widget (live chat, chatbot, or similar). First: tell me if one already exists and what it currently does.  
IF IT EXISTS AND WORKS PROPERLY: tell me it's fine, no changes needed.  
IF IT EXISTS BUT IS LIMITED/BROKEN: improve it per the requirements below.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: a floating chat widget (bottom-right corner, matching brand colors) that opens into a simple chat panel. Start with a rule-based flow: greet the visitor, offer 3-4 quick-reply buttons for common intents (Get a Quote, View Services, Talk to Team, Check Project Status), and route 'Talk to Team' to our WhatsApp number or contact form. Keep it lightweight -- do not add a large new dependency; build with plain React state. Note in your response where I could later plug in an actual AI/LLM API if I want smarter responses.

## 4. Portfolio / Case Study Deep-Dive Pages

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

#### PROMPT FOR AI:

Check my website codebase for existing individual case study or project detail pages (not just a portfolio grid/filter, which I already have). First: tell me if dedicated deep-dive pages per project exist, and if so whether they follow a Problem -> Solution -> Result structure with measurable outcomes.  
IF IT EXISTS AND IS CORRECT: tell me it's fine, no changes needed.  
IF IT EXISTS BUT IS THIN/INCOMPLETE: improve the structure and content per the requirements below.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: a dynamic route /portfolio/:slug (or similar) linked from my existing portfolio filter/grid. Each page should have sections for: Client/Project Overview, The Problem, Our Solution (with screenshots), The Result (with 2-3 measurable stats like 'load time improved 40%', placeholder stats if real data isn't available yet), and a CTA to start a similar project. Add unique SEO meta tags per case study via react-helmet-async.

## 5. 'Compare Us' Page

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

#### PROMPT FOR AI:

Check my website codebase for an existing comparison page (e.g. 'Why Us' or 'Compare' page). First: tell me if one exists and whether it does a structured feature-by-feature comparison.  
IF IT EXISTS AND IS CORRECT: tell me it's fine, no changes needed.  
IF IT EXISTS BUT IS JUST GENERIC TEXT (no real comparison table): improve it per requirements below.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: a new page (e.g. /why-hindustan-projects) with a comparison table: columns for 'Hindustan Projects' vs 'Freelancers' vs 'Other Agencies', rows for factors like Pricing Transparency, Support After Delivery, Communication, Turnaround Time, Code Ownership. Style as a clean responsive table (collapse to stacked cards on mobile) matching my brand colors. End with a CTA to get a quote.

## 6. Email Newsletter / Drip Sequence Setup

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my website/backend codebase for any existing email automation (newsletter signup, drip sequence, or transactional email setup beyond basic contact form notifications). First: tell me what currently exists.  
IF IT EXISTS AND IS PROPERLY SET UP: tell me it's fine, no changes needed.  
IF IT EXISTS BUT IS PARTIAL (e.g. only sends a single confirmation email, no sequence): improve it.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: check my backend (Node/Express/Prisma stack) for the existing email sending setup (e.g. Nodemailer or similar) and reuse it. Add a simple newsletter signup capture on the site if not already present. Design a 3-email drip sequence (Day 0 welcome + case study, Day 3 tips, Day 7 offer/CTA) as email templates, and set up the trigger logic to queue these when someone submits a lead form but hasn't converted. Note any third-party service you recommend (e.g. simple cron-based queue vs a service) given my current self-hosted VPS setup.

## 7. Referral / Affiliate Program Page

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my website codebase for any existing referral or affiliate program page. First: tell me if one exists and what it currently offers.  
IF IT EXISTS AND IS CORRECT: tell me it's fine, no changes needed.  
IF IT EXISTS BUT IS INCOMPLETE: improve it per requirements below.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: a new page explaining a simple referral program (e.g. 'Refer a client, get X% off your next project or a cash reward'). Include a simple referral submission form (referrer name, referrer contact, referred business name, referred contact) that stores to the same backend/lead system as my contact form (check codebase and reuse existing logic). Style to match brand.

## 8. Trust Badges & Certifications

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my website codebase (homepage and footer) for any existing trust badges, certifications, or partnership logos. First: tell me what currently exists.  
IF IT EXISTS AND IS DISPLAYED CORRECTLY: tell me it's fine, no changes needed.  
IF IT EXISTS BUT IS POORLY PLACED/STYLED: improve placement and styling.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: a trust badge strip (homepage, above footer) displaying certification/partnership logos (e.g. Razorpay Partner if applicable) as a responsive logo row, grayscale by default with color on hover. Make it a reusable `<TrustBadges />` component fed from a simple config array so I can add/remove badges easily. Use placeholder badge slots if I haven't provided actual logos yet.

## 9. Speed-Focused Landing Page for Ads

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my website codebase for any existing standalone/minimal landing page separate from the main site navigation (built for ad campaigns). First: tell me if one exists.  
IF IT EXISTS AND IS PROPERLY MINIMAL/FAST: tell me it's fine, no changes needed.  
IF IT EXISTS BUT STILL LOADS FULL SITE NAV/FOOTER/HEAVY ASSETS: strip it down per requirements below.  
IF IT DOES NOT EXIST: build it fresh.  
Requirements: a standalone route (e.g. /get-quote) with NO main site header/footer/nav -- just a focused hero, 3-4 trust bullet points, and a single lead capture form above the fold. Keep bundle size minimal for this route specifically (avoid importing heavy shared layout components). Optimize for fast First Contentful Paint. This page is meant for paid traffic, so keep it distraction-free with one clear CTA only.

## 10. Custom 404 Page + Internal Site Search

*This prompt tells the AI to check first, then decide: keep as-is / improve / build new.*

**PROMPT FOR AI:**

Check my website codebase for an existing custom 404 page and any internal search functionality. First: tell me what currently exists for both.  
IF BOTH EXIST AND WORK CORRECTLY: tell me it's fine, no changes needed.  
IF EITHER EXISTS BUT IS THE DEFAULT/GENERIC VERSION OR BROKEN: improve it per requirements below.  
IF EITHER DOES NOT EXIST: build it fresh.  
Requirements: (a) a branded 404 page matching my red/blue/white theme with a friendly message and a clear 'Back to Home' CTA plus links to popular pages (Services, Blog, Contact). (b) a simple internal search bar (in header or a dedicated /search page) that searches across page titles and blog post titles/content client-side (no need for a heavy search backend given current site size) and shows matching results with links. Keep both lightweight and consistent with existing routing setup (React Router or equivalent -- check what I'm using).

---

Priority tip: FAQ Schema + Testimonials + Case Study deep-dive pages give the fastest combined boost to both trust and SEO -- start with prompts 1, 2, and 4.
