

Hindustan Projects Website — SEO & Tools Implementation Prompts

Ready-to-use prompts for Claude Code (or any AI coding assistant) to implement traffic-growth and ranking features on hindustanprojects.in / itservices.hindustanprojects.in. WhatsApp widget and Portfolio Filter are already implemented, so those are skipped here.

PART 1 — SEO Foundation

1. On-Page SEO Tightening

PROMPT FOR AI:

Review my React + Vite + Tailwind website codebase. For every page/route, do the following:

- 1) Add a unique, keyword-rich <title> and meta description using react-helmet-async (reference existing helmet setup if present).
- 2) Ensure each page has exactly ONE <h1> tag, and enforce a logical H1 > H2 > H3 heading hierarchy -- fix any pages that violate this.
- 3) Add descriptive alt text to every tag based on its context/content.
- 4) Convert any non-SEO-friendly URLs (e.g. query params like ?id=123) into clean, readable route paths (e.g. /services/web-development).
- 5) Add relevant internal links between the Services, Blog, About, and Contact pages so link equity flows across the site.

List every file you changed and a summary of what was fixed in each.

2. Schema Markup (Structured Data)

PROMPT FOR AI:

Add JSON-LD structured data to my website (React + Vite + Tailwind, using react-helmet-async). Implement the following schema types:

- 1) Organization schema on the homepage (name: Hindustan Projects, logo, url, contact info, social profiles).
- 2) LocalBusiness schema with address, phone number, opening hours, and geo coordinates for our Rajasthan-based office.
- 3) Service schema for each individual service page (IT services, web development, etc.), describing the service, provider, and area served.

Inject each JSON-LD block via a reusable <SchemaMarkup> component so it's easy to update later. Validate the output structure against schema.org guidelines and show me the final JSON-LD for each page type.

3. Blog / Content Section

PROMPT FOR AI:

Create a Blog section for my React + Vite + Tailwind website. Requirements:

- 1) A /blog listing page showing post title, excerpt, cover image, and publish date in a responsive card grid matching my existing brand colors (red/blue/white).
- 2) A /blog/:slug dynamic route rendering full blog content from local markdown/MDX files or a simple JSON data file (choose the simpler approach given my current stack, explain your choice).
- 3) Each blog post component must set its own SEO title/meta description via

react-helmet-async.

4) Add pagination or 'load more' if there are more than 6 posts.

5) Create 3 starter blog post drafts (title + outline only, not full content) targeting these long-tail keywords: 'IT services cost in Rajasthan', 'Best web development company in Rajasthan', 'Corporate website vs custom portal – which does my business need'.

Set up the folder structure so adding a new blog post later is a simple copy-paste of one file.

4. Technical SEO (Sitemap, Robots.txt, Core Web Vitals)

PROMPT FOR AI:

Improve the technical SEO of my React + Vite website:

1) Generate a sitemap.xml covering all static and dynamic (blog) routes. Set it up so it auto-regenerates on build (use a Vite plugin like vite-plugin-sitemap if suitable).

2) Create a robots.txt allowing all crawlers and pointing to the sitemap.xml location.

3) Audit my images and convert any large PNG/JPG assets to WebP format, and add loading="lazy" to all below-the-fold images.

4) Check my current bundle for render-blocking resources and suggest/implement code-splitting or lazy-loading for heavy components (e.g. using React.lazy + Suspense).

5) Confirm the site is fully responsive at 375px, 768px, and 1280px breakpoints, and fix any layout issues you find.

Give me a before/after summary of what was optimized.

5. Analytics & Search Console Integration

PROMPT FOR AI:

Integrate analytics and search visibility tools into my React + Vite + Tailwind website:

1) Add Google Analytics 4 (GA4) tracking via gtag.js, loaded conditionally so it doesn't block initial page render.

2) Add the Google Search Console verification meta tag (I will paste in the verification code you request from me).

3) Set up basic custom event tracking for key actions: contact form submissions, WhatsApp button clicks, and quote/calculator tool submissions (once built).

Tell me exactly where in the codebase these were added and what values I need to fill in myself (e.g. GA4 Measurement ID).

PART 2 — Interactive Lead-Generation Tools

1. Website Cost / Quote Calculator

PROMPT FOR AI:

Build a 'Website Development Cost Calculator' as a React component (Tailwind styled, matching my red/blue/white brand colors) for my Hindustan Projects website.

Requirements:

- 1) Multi-step form: Step 1 - select project type (Business Website / E-commerce / Custom Web App / Office Portal). Step 2 - select number of pages (1-5, 6-10, 10+). Step 3 - select features (checkboxes: CMS, Payment Gateway, User Login, Admin Dashboard, SEO Setup, Multi-language).
- 2) On the final step, calculate and display an estimated price RANGE (not exact price) based on selections using a simple weighted logic I can edit later in a config file.
- 3) End with a lead-capture form (Name, Phone, Email, brief message) that submits to our existing contact API endpoint / form handler -- check my codebase for the existing contact form submission logic and reuse it.
- 4) Make it a standalone component I can drop into any page via `<CostCalculator />`. Show me the final component code and where to import it.

2. Free Website Audit Tool

PROMPT FOR AI:

Build a 'Free Website Audit' tool as a React component for my website. Requirements:

- 1) A single input field where a visitor pastes their website URL.
 - 2) On submit, call Google PageSpeed Insights API (I will provide the API key) to fetch performance score, SEO score, accessibility score, and mobile-friendliness.
 - 3) Display results as simple visual score cards/gauges (use a lightweight chart library already in my project if available, otherwise plain CSS progress bars -- don't add a new heavy dependency).
 - 4) Below the results, add a clear CTA: 'Want us to fix these issues? Get a free consultation' linking to the contact form/WhatsApp.
 - 5) Handle errors gracefully (invalid URL, API failure, rate limits) with a friendly message.
- Tell me exactly where to plug in the PageSpeed API key as an environment variable.

3. Digital Marketing Budget Planner

PROMPT FOR AI:

Build a 'Digital Marketing Budget Planner' as a React component for my website.

Requirements:

- 1) Ask the visitor 3 simple questions via dropdowns/radio buttons: their industry/business type, their monthly revenue range, and their primary goal (Brand Awareness / Lead Generation / Sales).
 - 2) Based on the answers, show a suggested monthly digital marketing budget RANGE and a rough split across channels (e.g. SEO, Paid Ads, Social Media, Content) as a simple horizontal bar breakdown -- use logic I can edit later in a config object.
 - 3) End with a CTA to book a free consultation, linking to our contact form/WhatsApp.
 - 4) Style it to match my existing red/blue/white brand theme and make it mobile responsive.
- Provide the full component code and usage instructions.

4. Tech Stack Recommender Quiz

PROMPT FOR AI:

Build a short interactive quiz called 'Which Tech Stack Is Right For Your Business?' as a React component for my website. Requirements:

- 1) 4-5 multiple choice questions about the visitor's business needs (e.g. budget range, need for e-commerce, expected traffic scale, need for custom features, timeline).
- 2) Based on answers, recommend one of: 'WordPress/CMS', 'React + Vite Business Site', or 'Custom Full-Stack Web App' with a short (2-3 line) explanation of why it fits them.
- 3) Make it feel engaging -- one question per screen with a progress bar, smooth transitions between questions using simple CSS transitions (no new animation library needed).
- 4) End with the recommendation plus a CTA button to 'Discuss this with our team' linking to contact/WhatsApp.
- 5) Make the whole quiz shareable via a simple 'Share your result' button (Web Share API with clipboard fallback).

Provide the full component code.

5. Free Downloadable Resource (Lead Magnet)

PROMPT FOR AI:

Set up a 'Free Resource Download' section on my website. Requirements:

- 1) A landing block promoting a downloadable PDF titled 'Website Launch Checklist' (I will provide the actual PDF file separately).
- 2) A short email-gate form (Name + Email) before the download link is revealed/triggered.
- 3) On submit, store the lead (reuse my existing contact form backend/database logic if available -- check the codebase first) and then trigger the PDF download.
- 4) Style the section to match my red/blue/white brand and make it embeddable as `<ResourceDownload />` on any page (e.g. blog posts, homepage footer).

Show me where the existing lead storage logic lives so this reuses it instead of creating a duplicate system.

Tip: Feed these prompts one at a time to Claude Code inside your project repo so it has full context of your existing codebase before making changes.
